mitochondrial outer membrane protein TOM71 - yeast (Saccharomyces cerevisiae)

Miletrnate names: protein YMR117w
C;Species: Saccharcmyces cerevisiae
C;Species: Saccharcmyces cerevisiae
C;Species: Saccharcmyces cerevisiae
C;Date: 13-01-1995 #sequence_revision 10-Feb-1995 #text_change 09-Jul-2004
C;Accession: \$48959; \$52886
R;Latreille, P.
Submitted to the EMBL Data Library, May 1994
A;Description: The sequence of S. cerevisiae cosmid 8263.
A;Reference number: \$46676

structural polyprotein - Venezuelan equine encephalitis virus (strain TC-83)
N;Contains: 6K peptide; coat protein; membrane glycoprotein E1; membrane glycoprotein E2;
C;Species: Venezuelan equine encephalitis virus
C;Accession: A27891
R;Johnson, B.J.B.; Kinney, R.M.; Kost, C.L.; Trent, D.W.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 9, Ag

Sequence 9, Application US/08487748A

Patent No. 5721351

GENERAL INFORMATION:
APPLICANT: Levinson, Douglas A.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE
TITLE OF INVENTION: TREATMENT AND DIAGNOSIS OF IMMUNE DISORDERS;
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
CORRESPONDENTY: U.S.A.
STATE: New York
COUNTRY: U.S.A.
                                                                                                                                                                                                          Gaps

DNA encoding kidney injury related molecule - which is upregulated in injured or rejenerating tissue, useful to promote growth of new tissue and survival of damaged tissue.

Ï

Claim 9; Page 46-47; 68pp; English.

This protein, designated kidney injury related molecule (KIM), is upregulated in injured or regenerating tissue. Its amino acid sequence was deduced from a clone (see AAT96035) obtained from a human embryonic liver library. A 572-amino acid (see AAM98335) and a 307-amino acid rat KIM (see AAM38334) are also claimed. Recombinant KIM polypeptides can be expressed in prokaryotic and eukaryotic host cells using a claimed process. Soluble variants fused to a toxin, imageable compound or radionuclide, and IgG fusion proteins are also claimed. KIM, or an agonist, can used to treat renal disease and to promote the growth of new tissue or the survival of damaged tissue, generally in conditions where the binding of specific ligand to KIM stimulates cell growth, maintains

                                                                                                                                                                                                                                                                                                                                                                                                   9
cellular differentiation or reduces apoptosis, e.g. in cases of renal failure, nephritis, kidney transplants, toxic or hypoxic injury. A monoclonal antibody specific for KIM can be used to treat renal disease, e.g. where binding of KIM to ligand results in neoplasia, loss of cellular function, susceptibility to apoptosis or promotion of inflammation, deliver imaging agents to KIM expressing cells in vivo or la neitz and measure KIM concentration by immunoassay.

Manage/regeneration of renal cells can be determined by measuring KIM, particularly to diagnose or monitor the progress of disease or therapy. Afthe-expressing tumour cells can be inhibited by treatment with a fusion protein comprising KIM ligand or Mab with a toxin or radionuclide, and tumour cells that express KIM ligand can be inhibited with similarly tagged KIM or anti-KIM ligand can be inhibited with similarly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel antibody, antibody derivative or antigen -binding polypeptide that inhibits proteclytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a protein relating to the KIM-1 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                  9

The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (IM) family. This protein has 34 amino acids or (1g) and mucin domain (TIM) family. This protein has 34 amino acids or 159 amino acids ADO76690, depending on splice variation. It has been discovered that treatment of a mammal with a KIM-1 antagonist alters the cinteraction of T cells and other immune system cells, e.g. dendritic cells, monocytes, macrophages and B cells, and thereby strongly suppresses an IgG response to antigen. Such treatment also eliminates (IgG) production by memory B cells in response to subsequent challenge with the antigen. Blockage of the binding of KIM-1 to its receptor reduces secretion of interferon-gamma by immune cells engaged in an antigen response in the mixed lymphocyte response assay. Based on these discoveries, the invention provides method is claimed for inhibiting condulating immune system. A method is claimed for inhibiting and ammal. The method involves identifying a mammal with an immune disease or disorder, or one preparing to receive a tissue graft, and administering a KIM-1 antagonist, sepecially a polypeptide comprising: a KIM-1 antagonist, sepecially a polypeptide comprising: a KIM-1 antagonist, sepecially a polypeptide of an anti-KIM-1 antibody. Preferably, the KIM-1 antagonist is used in method set coty the antagonist may be conjugated to a polymer such as an RC moiety. The antagonist may be conjugated to a polymer such as an RC moiety. The antagonist may be conjugated to a polymer such as in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting epitope spreading in an autoimmune disease; inhibiting energy of an ant polygrteritis nodosa, rapidly progressive crescentic glomerulonephritis, graft-versus-host disease, or systemic lupus nephritis) or inflammatory disease or disorder (e.g. inflammatory bowel diseases such as Crohn's disease, ulcerative colitis, and ileitis); and inhibiting secretion of idiopathic thrombocytopenia purpura, Wegener's granulomatosis, Sequence 334 AA;

ABR58521 to ABR58709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a crosp screening assay. The nucleic acid is useful as diagnostic markers or therapeutic targets. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, cancreas, prostate, skin and uterus), wounds, ischaemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in carry and accenting, particularly for identifying agents for treating these

domain-1 (TIM-4) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved 1gV and mucin domains. The locus comprising the TIM family is genetically associated with immune dysfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM proteins, which critically regulate CD4 T cell springiation. Thi cells preferentially express TIM-3, while Th2 cells preferentially express TIM-1. TIM polypeptides and polymucleotides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IVWINGTHVIYYRKDTRYKLLGDLSRRDVSLTIENTAVSDSGVYCCRVEHRGWFNDMKIIV 120

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contexting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is 80 % identical to a cape that selectively hybridises to a sequence that is 80 % identical to a cape the human bladder cancer-associated proteins given in ABR48166 to ABR48242). Bladder cancer-associated proteins given in hapR48166 to have cytostatic activities, and can be used in antisense gene therapy and can vectorine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                          Detecting a bladder cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 IVWTNGTHVTYRKDTRYKLLGDLSRRDVSLTIENTAVSDSGVYCCRVEHRGWFNDMKITV 120

The invention relates to a novel antibody, antibody derivative or antigen binding polypeptide that inhibits protoclytic release of a soluble kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells. The antibody, antibody derivative or antigen-binding polypeptide is useful for treating or preventing renal disease or injury, e.g. renal cancer. The antibody is also useful for inhibiting shedding of the KIM-1 polypeptide. This sequence represents a protein relating to the KIM-1 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SLEIVPPKVTTTPIVTTVPTVTTVRTSTTVPTTTTVPTTTMSIPTTTTVPTTMTVS 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated human NOVX polypeptide, where X is la to 1d or 2a to 2h, or its mature form, a sequence that is at cleast 95 % identical to it, or a sequence comprising one or more conservative substitutions in the amino acid sequence. The NOVX polypeptide, and nucleic acid sequence encoding it, has cytostatic and antiinflammatory activities, and can be used in gene therapy, and in vaccines. The NOVX polypeptide is useful for preparing a composition for treating or preventing a pathology associated with NOVX polypeptide e.g. renal cancer or inflammation, or for tissue typing. The present sequence represents human NOV1b from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating antibodies and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal necvascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present

The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (199 I cell and mucin domain (TIM) family. This protein has 344 amino acids and member of the T cell immunoglobulin (199 I cell and mucin family amily. This protein has 344 amino acids depending on splice variation. It has been discovered that treatment of a mammal with a KIM-1 antagonist alters the interaction of T cells and other immune system cells, e.g. dendritic cinteraction of T cells and other immune system cells, e.g. dendritic cinteraction by memory B cells in response to subsequent challenge with the antigen. Blockage of the binding of KIM-1 to its receptor reduces secretion of interferon-gamma by immune cells engaged in an antigen response in the mixed lymphocyte response assay. Based on these cills contained in autoinmune disease and other disorders of the mammalian immune system. A method is claimed for inhibiting cell, in a mammal. The method involves identifying a mannel with an immune disease or disorder, or one preparing to receive a tissue graft, and administering a KIM-1 antagonist, especially a polypeptide comprising a KIM-1 antagonist, especially a polypeptide comprising a KIM-1 antagonist, especially a polypeptide comprising a comprising a mati-KIM-1 antibody. Preferably, the KIM-1 antagonist is a coluble polypeptide, which can include a heterologous moiety such as an FC couple polypeptide, which can include a heterologous moiety such as an FC couple polypeptide and gomain, and may include a heterologous moiety such as an FC couple polypeptide which can include a heterologous moiety such as an FC couple polypeptide and gomain, and may include a heterologous moiety such as an FC couple polyment glycol. The KIM-1 antagonist is used in method sease relapse cinhibiting activation of a B cell in a mannel. The antagonist and disease conjugated disease (Grave's disease; treating a FL andar disease (Grave's disease; treating a FL andar disease (Grave's

The specification describes TIM-1, TIM-2, TIM 3 and TIM-4. TIM polypeptides are cell surface molecules with conserved gy and mucin domains. The locus comprising the TIM family is genetically associated with immune dysfunction, including asthma. The TIM genetically associated with immune dysfunction, including asthma. The TIM commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway associated with protection against these responses. T cells express TIM preferentially express TIM-3, which critically regulate CD4 T cell differentiation. Thi cells preferentially express TIM-3, while TH2 cells preferentially express TIM-1. TIM polypeptides and polymoclades are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases

The present sequence is a human T cell immunoglobulin domain and mucin domain-1 (TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is genetically associated with immune dysfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM preferentially express TIM-2, while TLM cells preferentially express TIM-3, while TLM cells preferentially express TIM-3, while TLM cells preferentially express TIM-1. TIM polypeptides and polymucleotides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                New nucleic acid comprising a mammalian T cell Immunoglobulin domain and Mucin domain gene sequences, useful for treating cancer or asthma, allergy, eczema or autoimmune disease.

                                                                                                                  The present sequence is a human T cell immunoglobulin domain and mucin domain-1 (TIM-1) polypeptides. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is senetically associated with immune dysfunction, including asthma. The TIM gene family is located with immune dysfunction, including asthma. The TIM commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperreactivity and allergic T cell responses, and other variants hyperteactivity and allergic T cell responses, and other variants protection against these responses. T cells express TIM protection, which critically regulate CD4 T cell differentiation. Thi cells preferentially express TIM-1 and polymologogides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     IVWINGTHVTYRKDTRYKLLGDLSRRDVSLTIENTAVSDSGVYCCRVEHRGWFNDMKITV 120

The present sequence is a human T cell immunoglobulin domain and mucin domain-1 (TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is conserved IgV associated with immune dysfunction, including asthma. The TIM genetically associated within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway hyperractivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM protections, which critically regulate CD4 T cell differentiation. This cells preferentially express TIM-3, while Th2 cells preferentially express TIM-1. TIM polypeptides and polynucleotides are useful for treating cancer, asthma, allergies, eczema or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TTLQCAIRREPTSSPLYSYTTDGNDTVTESSDGLWNNQTQLFLEHSLLTANTTKGIYAG 294

The present sequence is a human T cell immunoglobulin domain and mucin domain-1 (TIM-1) polypeptide. The specification describes TIM-1, TIM-2, TIM-3 and TIM-4. TIM polypeptides are cell surface molecules with conserved IgV and mucin domains. The locus comprising the TIM family is genetically associated with immune disfunction, including asthma. The TIM gene family is located within a region of human chromosome 5 that is commonly deleted in malignancies and myelodysplastic syndrome. Variants of TIM-1 and TIM-3 are associated with susceptibility to airway chyperractivity and allergic T cell responses, and other variants associated with protection against these responses. T cells express TIM proteins, which critically regulate CD4 T cell differentiation. This cells preferentially express TIM-3, while Th2 cells preferentially express TIM-3, while Th2 cells preferentially express TIM-1. TIM polypeptides and polynucleotides are useful for treating cancer, asthma, allergies, eczeme or autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid comprising a mammalian T cell Immunoglobulin domain and Mucin domain gane sequences, useful for treating cancer or asthma, allergy, eczema or autoimmune disease.
